Nestle's stock price exhibits a strong upward trend accompanied by a high standard deviation, with the mean deviating by approximately ₹401. This indicates that the mean is not a reliable measure of central tendency given the series' high volatility. The ADF test on the price series yielded a p-value above 0.05, leading us to accept the null hypothesis — confirming the presence of autocorrelation (i.e., today's price is influenced by yesterday's price) and indicating that the series is non-stationary. However, once the differenced series (return series) is analyzed, the p-value drops to 0, rendering the data stationary (rejecting the unit root) and suitable for further time-series analysis.
